Project Design Phase
Proposed Solution Template

Date	2 October 2026
Team ID	SWTID-2026-4524
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	2 Marks

Team Leader: Swathi R | Team Members: Sandhiya D, Sandhya Charlet Calista S, Mallemkonda Dallyjasmine | Team Size: 4

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Incident records need consistent and accurate data for correct triage, routing and resolution. When the system relies only on user awareness and manual checks, records can be submitted incomplete, inconsistent or incorrect. This affects reporting accuracy, SLA compliance and overall service quality. There is a need to enforce conditional field behaviour and validation directly on the Incident form.
2.	Idea / Solution description	Use ServiceNow UI Policies and Client Scripts to enforce data rules on the Incident form: • UI Policy "High Impact Control" makes Assignment group mandatory when Impact is 1 – High, with Reverse if false turned on. • A UI Policy Action makes the Urgency field read-only for High impact. • onChange Client Script sets Urgency to High automatically when Impact is High. • onSubmit Client Script blocks the save when Impact is High and Assigned To is empty. • onCellEdit Client Script blocks direct edits of State in the list view.
3.	Novelty / Uniqueness	The solution combines no-code UI Policies with Client Scripts, so one Impact value controls mandatory fields, read-only fields, auto-updates and save validation together. Rules are enforced before the record is submitted, and Reverse if false returns the form to normal automatically. The onCellEdit script also closes the gap where list editing skips the form rules. It is lightweight and needs no external tools.
4.	Social Impact / Customer Satisfaction	Service desk teams get complete and reliable Incident data, so tickets are routed and resolved faster and fewer SLAs are missed. Agents get clear messages on the form instead of finding mistakes later, which reduces rework and frustration. End users who raise Incidents get quicker and more accurate service.

S.No.	Parameter	Description
5.	Business Model (Revenue Model)	This is a micro project built for learning and demonstration, so it does not have direct revenue. The value for an organisation comes from savings: less rework, better data quality and fewer SLA breaches. The same configuration can also be reused by ServiceNow teams as a ready-made data quality package or offered as a configuration service.
6.	Scalability of the Solution	The rules apply to every Incident record and every user on the instance with no extra effort. The same approach can be extended to other fields, conditions and tables (for example Change or Problem) by adding more UI Policies and Client Scripts, and the configuration can be moved to other instances.
