Project Design Phase
Solution Architecture

Date	2 October 2026
Team ID	SWTID-2026-4524
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Team Leader: Swathi R | Team Members: Sandhiya D, Sandhya Charlet Calista S, Mallemkonda Dallyjasmine | Team Size: 4

Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behavior, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

Solution Architecture Diagram:

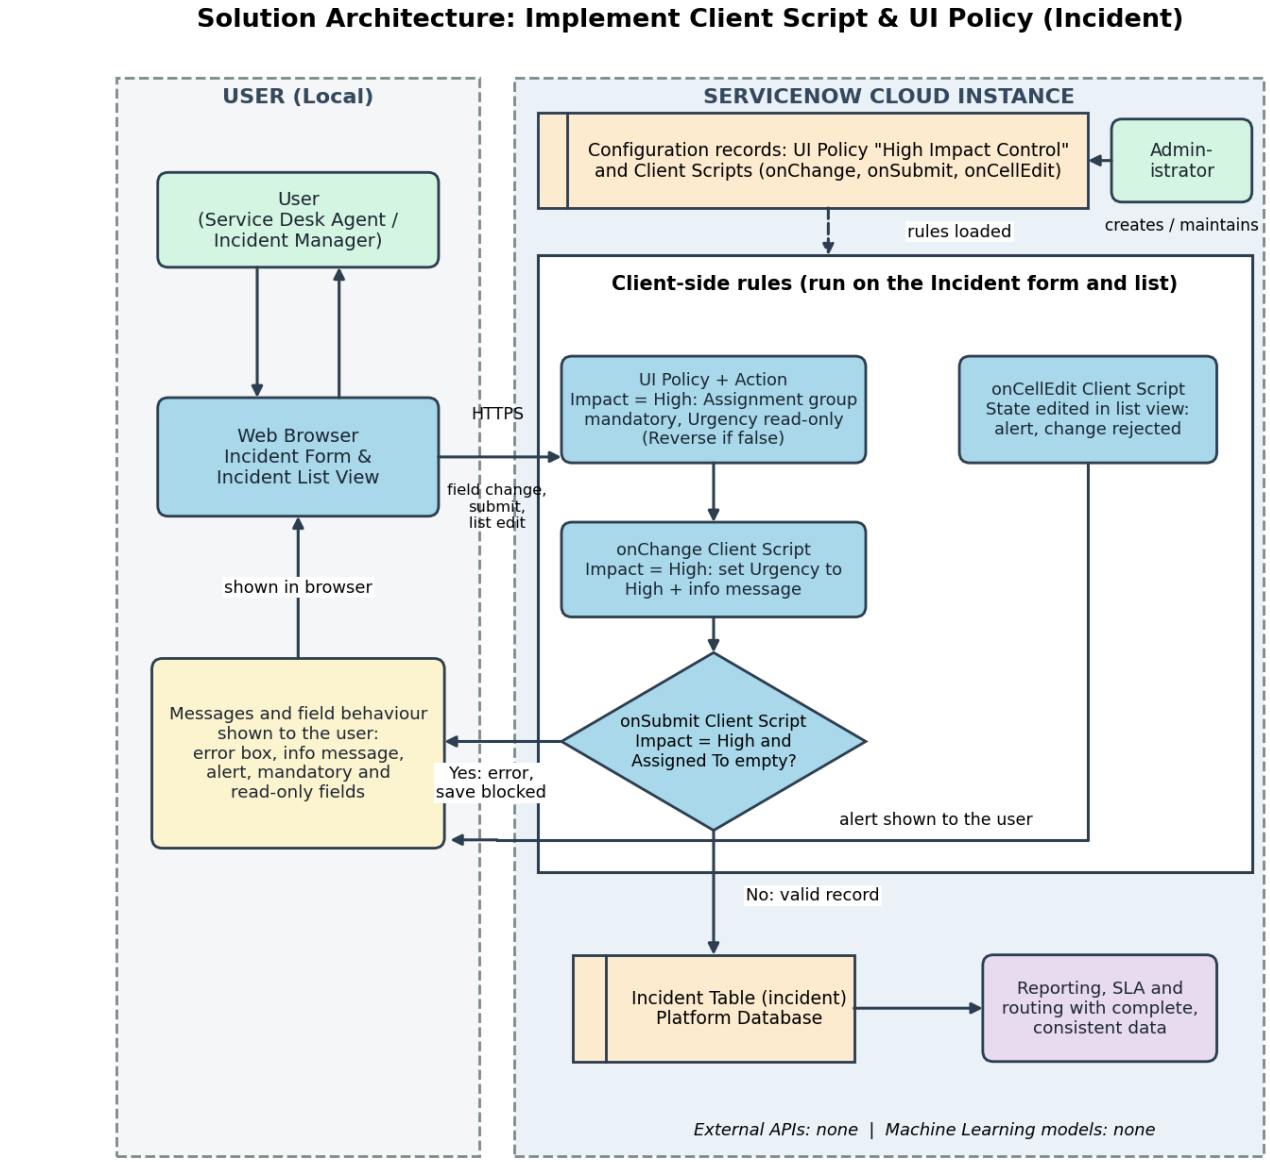

Figure 1: Architecture and data flow of the Implement Client Script & UI Policy (Incident) solution

1. The Administrator creates the UI Policy "High Impact Control" and the three Client Scripts. They are stored as configuration records in the ServiceNow instance.
2. The user opens the Incident form or list in the web browser. Field changes, submit and list edits are handled by the client-side rules.
3. The UI Policy makes Assignment group mandatory and Urgency read-only when Impact is High (Reverse if false undoes this). The onChange script sets Urgency to High and shows an info message.
4. On submit, the onSubmit script checks Impact and Assigned To. If Assigned To is empty for a High impact Incident, an error is shown and the save is blocked. Otherwise the record is saved in the Incident table.
5. The onCellEdit script rejects State edits in the list view and shows an alert. Saved Incidents have complete and consistent data for reporting, SLA tracking and routing.
