Project Design Phase-II
Solution Requirements (Functional & Non-functional)

Date	2 October 2026
Team ID	SWTID-2026-4524
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Team Leader: Swathi R | Team Members: Sandhiya D, Sandhya Charlet Calista S, Mallemkonda Dallyjasmine | Team Size: 4

Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	UI Policy Configuration (High Impact Control)	Create UI Policy "High Impact Control" on the Incident table (System UI → UI Policies) Set condition: Impact is 1 – High Make Assignment group mandatory when the condition is met Enable Reverse if false so changes are undone when the condition is not met
FR-2	UI Policy Action – Urgency	Add a UI Policy Action on the Urgency field Make Urgency read-only when Impact = High, keeping the field visible Restore Urgency to editable when Impact is changed to another value
FR-3	onChange Client Script – Auto set Urgency	Run the script when the Impact field value changes Set Urgency to 1 – High when Impact is 1 – High Show the info message "Urgency set to High for High impact incident."
FR-4	onSubmit Client Script – Save Validation	Check Impact and Assigned To when the user saves the Incident Show an error on Assigned To if Impact is High and Assigned To is empty Block the save until Assigned To is filled
FR-5	onCellEdit Client Script – List Edit Control	Monitor the State field when edited directly in the Incident list view Show an alert that State cannot be updated using list editing Reject the change so the State value remains unchanged Allow State updates from the Incident form
FR-6	Testing & Verification	Test mandatory enforcement and successful save Test the reverse condition (High to Medium) Test list edit blocking and form-based State update

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	Clear error and info messages (for example, "Assigned To is mandatory for High impact incidents.") guide the user on the form itself. Mandatory and read-only fields are shown directly, and Urgency is set automatically, so less manual effort is needed.
NFR-2	Security	Only users with administrative or configuration access can create or change UI Policies and Client Scripts. Read-only Urgency and blocked list edits of State prevent unwanted changes to controlled fields.
NFR-3	Reliability	The rules run the same way on every form load, field change and save. Reverse if false returns fields to their normal behaviour, and Incidents cannot be saved when the required condition is not met.
NFR-4	Performance	The scripts are lightweight and run in the browser, so validation and field updates happen instantly without extra server calls and without slowing the Incident form.
NFR-5	Availability	The UI Policy and Client Scripts are part of the ServiceNow instance, so they are available whenever the Incident form is available. No separate service or integration is needed.
NFR-6	Scalability	The same rules apply to all Incident records and users. New conditions, fields or tables can be added by creating more UI Policies or Client Scripts without redesigning the solution.
